About Me

Software Engineer with experience in full-stack web development, mobile applications, cloud technologies, and AI-powered automation. Passionate about building scalable, cost-efficient systems and developer tools, with a focus on system design: event-driven workflows, distributed storage, caching, and low-latency architectures. Building a personal agentic AI ecosystem using Hermes integrated with Discord, focused on intelligent automation, clean engineering practices, and shipping reliable products with measurable impact.

Education

Keshav Memorial Institute of Technology, Hyderabad

2022 – 2026

B.Tech in Computer Science and Engineering

Relevant Coursework: Computer Networks, Operating Systems, Database Management, Software Engineering

Experience

5th Bridge Data Technologies

Jun 2026 – Present

Software Engineer

Hyderabad

- Built a role-based web platform for social media advertising agencies using React, Node.js, and Convex to manage influencer partnerships, from campaign creation to collaboration offer distribution.
- Developed an AI-powered application using React, Node.js, and SQLite that identifies trending reel ideas by combining real-time news aggregation with LLM-based content generation for content teams.
- Engineered a cost-optimized AI pipeline using React and Node.js that transforms text prompts into short-form videos, designing prompt and model-inference optimization to reduce generation costs while maintaining output quality.
- Designed and implemented an event-driven, low-latency trading infrastructure using Node.js, ClickHouse, and PostgreSQL, enabling real-time market alerts and fast order execution across multiple markets.

5th Bridge Data Technologies

Jan 2026 – Jun 2026

Software Engineer Intern

Hyderabad

- Designed and evaluated predictive models using Python, scikit-learn, and Pandas, combining machine learning and rule-based approaches with simulation and backtesting techniques.
- Built an NLP pipeline using Python, PyTorch, and Transformers to extract insights from unstructured text data.
- Implemented systems using Python, an LLM, and a search layer to verify signals for real-time identification of emerging trends from continuous data streams.

Technical Skills

- **Languages:** C#, Java, Python, TypeScript, JavaScript, C++, Bash, Lua
- **Backend:** ASP.NET, Node.js, Express, Django, FastAPI
- **Frontend:** React, React Native, Expo, ElectronJS, TailwindCSS, Nativewind
- **Databases:** Microsoft SQL Server, PostgreSQL, MongoDB, MySQL, SQLite, Redis, Convex
- **Cloud, DevOps & CI/CD:** Docker, GitHub Actions, Amazon Web Services, Vercel, MinIO
- **AI/ML:** PyTorch, Transformers, Scikit-learn, XGBoost, LightGBM, NumPy, Pandas, Matplotlib, Jupyter
- **Tools:** Git, GitHub, Mercurial

Projects

Schedio: Project Sharing Platform

React, Node, Express, Gemini API, MongoDB, Scrapy, Vercel, Docker

github.com/vsreddyh/schedio

- Built a full-stack collaboration platform connecting students, colleges, and recruiters for project discovery and collaboration, featuring role-based access control and profile management.
- Scraped data from over 10,000 colleges to create an institutional dataset.
- Implemented advanced search, filtering, and code exploration tools with tokenized search, plagiarism detection, and AI-powered code explanations (Gemini API).
- Enabled file uploads (code, images, videos), analytics, PDF exports, and contributor management, streamlining project sharing and evaluation.

- Dockerized for development/production, and deployed on Vercel for live access.
- **Demo:** schedio-coral.vercel.app

Identiscan: Scalable Face Recognition Based Attendance System

React, TailwindCSS, Node, Express, Flask, MongoDB, ElectronJS

github.com/vsreddyh/identiscan

- Engineered a self hostable, scalable facial recognition attendance system using Python and the face_recognition library, achieving 99.38% accuracy in identifying individuals.
- Built a comprehensive web portal for managing attendance records, including batch wise and class wise organization, and a student dashboard interface to check attendance status.
- Created an application for Linux using ElectronJS, which featured a custom-built virtual keyboard for seamless use on touchscreen devices.

Anonymous Image Gallery: Cost Optimized Image Ingestion Pipeline

React, FastAPI, Redis, MongoDB, MinIO, Docker Compose, Amazon S3

github.com/vsreddyh/Minio-S3

- Designed an event-driven, cost-optimized media ingestion pipeline: uploads hit MinIO for fast, bursty ingest. A nightly mirror syncs to S3 and purges MinIO. Access is short-lived via signed S3 URLs.
- Reduced S3 costs by cutting noisy request overhead and only retaining curated files in S3 (about 10–25% fewer request charges).
- Developed a FastAPI backend that issues presigned URLs. Stores a list of images in MongoDB. Used Redis for caching signed URLs, cutting latency on repeat access.
- Containerized the stack with Docker Compose. Bun/Vite frontend, FastAPI backend, MongoDB, Redis, and MinIO for reproducible local and cloud deployment.

Warner-bash: Hardware Resource Monitor Script

github.com/vsreddyh/warner-bash

BashScript, Linux

- Authored a lightweight Bash script to monitor CPU, RAM, Disk, and Temperature usage on Linux systems.
- Implemented real time notifications that trigger when user defined thresholds are crossed, preventing potential hardware damage due to overheating or overuse.

Saanjh Sahayak: Clinical Decision Support Mobile App

github.com/vsreddyh/mysaanj

React Native, Expo, Nativewind, Node, Express, Gemini API, MongoDB, Vercel

- Building a cross-platform mobile application to assist doctors in clinical decision-making and patient data management.
- Integrating AI (Gemini API) to predict disease risks from patient inputs, reducing review time and improving diagnostic accuracy.
- Designed a secure Node.js + MongoDB backend to handle patient records and model predictions with scalable API endpoints.
- Ongoing personal project.

Journal, Diary and ToDo App: Unified Productivity Platform

React, Django, Redis, PostgreSQL

github.com/vsreddyh/MyDiary

- Building a web-based productivity application combining To-Do lists, Journals, and Diaries for streamlined personal task tracking.
- Implemented automated journaling where completed tasks are logged into the user's daily journal for better activity insights.
- Engineered performance optimization using Redis caching (server-side) and IndexedDB (client-side), reducing database queries significantly.
- Ongoing personal project.

Certifications

- Google Project Management Certificate
